

Two ways to run the next 45 days

NOW **65.9 kg**GOAL **60 kg**TO LOSE **5.9 kg**

You are what you eat, so both ways start in the kitchen: you follow the meal plan either way, and **the food alone already works**. The second way is the same plan **plus movement**: daily walks, a little strength, a couple of 16:8 days. For Pilar, movement is the bigger lever, because she is small and should not cut the food much (never below the safe floor). Both keep her muscle when protein stays high, and week 1 drops fastest because of water.

WEIGHT ON THE SCALE OVER 45 DAYS · START 65.9 KG · GOAL 60 KG

Relaxed: only the food

Movement	same as now (home, light)
Daily burn	~1,700 kcal
Eat	~1,350 to 1,400
Deficit	~300 to 350 / day
Fat loss	~0.3 kg / week

In 45 days: **~3 kg**

All gas: food + movement

Movement	+ daily walks, light strength 2-3x, 2-3 days 16:8
Daily burn	~1,950 to 2,000 kcal
Eat	~1,300 (not below 1,200)
Deficit	~650 to 700 / day (safe max)
Fat loss	~0.6 kg / week

In 45 days: **~5 kg**

The goal of 60 kg (the full ~6 kg) is a 2 to 4 month job depending on the movement: these 45 days are the strong start, and the all-gas path lands her almost there. Week 1 drops fastest because of water and glycogen, not all fat, so trust the weekly average. Keep protein high (about 110 to 120 g a day) and add a little strength, or the extra loss turns into muscle instead of fat. Do not eat below about 1,200 kcal: for Pilar, faster comes from moving more, never from eating less.
